**Q: Automorphism groups in the simplest possible case** For a ring  $A$ , the automorphism group  $\text{Aut}(A)$  is a subgroup of the symmetric group  $S_n$  of the elements of  $A^n$  that map  $x$  to  $y$  for every  $x, y \in A$ . Given a finite group  $G$ ,  $G$  acts on  $G$  by group automorphisms. If  $F$  is the fixed set of this  $G$ -action, then there is an injection  $\text{Aut}(G) \rightarrow (\mathbb{Z}_2)^F$  that takes an automorphism of  $G$  to its restriction to  $F$ . If there is no fixed point of this restriction, then the  $G$ -action is orientation-reversing (i.e. there is no automorphism of  $G$  that maps each element to its inverse). If  $G$  is a group with  $|G| \geq 1$ . For example,  $C$  is the trivial group if  $G$  is a finite group, and  $C$  is the cyclic group of order 2 if  $G$  is a subgroup of  $D_4$ , the dihedral group of order 8. Let  $\text{Aut}(C)$  be the group of automorphisms of  $C$ . I want to prove that the induced map  $\text{Aut}(C) \rightarrow \text{Aut}(G)$
