We are from small team and work hard to keep this site in best condition.Q: Input parsing in C I'm new to C and to programming in general, and I'm having some troubles understanding the concept of parsing input. I'm aware that this is an easy question, and that it's a very basic principle, but as I said, I'm new to this field. The question is: When I run the program, it prints out the argument like so: ./a.out -a 123 -b 12 -c -- -d 35 -e 456 -f 1234 I understand the output of this, however, I don't understand how the program knows what kind of input to accept. If I enter: ./a.out -a I get the same output as above. I think I'm getting confused with arguments. It's the same, right? It has the same name, it gets the same number of arguments, it's just the string to the arguments that's changed. Why is this? Is it just a coincidence, or is there a proper way of parsing this? A: It's exactly the same, but this is the expected behavior. Consider a bash command line ./foo -a ./foo -b ./foo -c ./foo -d These commands will interpret the -a as a switch, the -b as a switch, and the -c as a switch, but then the next argument to ./foo is the name of the script -d, not the switch. You can get

In 2015, the Telugu superstar Nagarjuna-Prabhu starrer Loafer released in Telugu, Tamil and Hindi.
