introductions in 1999Q: How to install Qt from the command line on Mac OSX? I've
been trying to install Qt Creator with brew on my Mac, but I can't get it to work. I know
that it's possible to do it with the GUI, but I'd prefer to use the command line, to know
what's going on more easily. I'm aware that there are instructions here, but those were
outdated and not working for me. I'm on Mac OSX Sierra. The error I get is this one:

clang -cc1 version 3.9.0-2~Sierra~ML build for macosx10.12 Apple LLVM version 10.0.0 (clang-1000.11.45.5) Target: x86_64-apple-darwin16.7.0 configure: error: unrecognized option '--with-Qt-and-Qt4' It appears that the error isn't about Qt, it's about gcc. Can someone help me with that? A: As of macOS Sierra, Apple has removed the "Homebrew" command line tool that is used to install software in the Homebrew package manager. Instead, in macOS Sierra, you can now download precompiled binaries of software in the Mac App Store. I'm writing this answer because Homebrew's build of Qt (Qt5 and Qt4) is maintained for use by those of us who are running Homebrew and need the very latest version of Qt (or the minor releases that might be needed in a Homebrew package that depends on a newer version of Qt). I am hoping that this answer might help you to continue using Qt and Homebrew without having to download Qt directly from Qt's website. Qt 5.12 is now a valid version to download from the Mac App Store (as of 2019, March). You can download Qt 5.12 using these instructions. Qt 5.10 is now a valid version to download from the Mac App Store (as of 2018, February). You can download Qt 5.10 using these instructions. Qt 5.9 is now a valid version 2d92ce491b
