Energy dependence of the vorticity structure factor in dense fluids. We calculate the vorticity structure factor (VSF) $S_{[s]}(k)=k^2$ for a molecular model of the liquid. The VSF is completely determined by a comparison with the dynamic structure factor $S(k, \omega)$ measured by two-time correlation functions. The VSF shows plateaus on top of a structure factor which is essentially proportional to $k^2-k^2_{[0]}$. The effective temperature is well defined in the low- ω regime up to a very low frequency while the plateau frequency remains always above the structural anomaly. Hence, contrary to what happens in the dynamic structure factor, the VSF does not show a plateau on top of the structural anomaly. We expect that the behavior of $S(k, \omega)$ in the liquid and the existence of a well defined plateau for the VSF are related to the fact that the static VSF does not measure the absolute potential energy of the system. The contribution to the VSF from the huge energy fluctuations below the structural anomaly is much larger than that from the high-energy contributions. So you want to be a writer? This post is all about my journey as a writer. I have recently released my first e-book and have put a lot of time and effort into it, but although I made it as far as I have so far in my career, I have a long way to go. I have experienced many highs and lows in my journey of becoming a writer, and I feel I have learnt more from my successes than my failures. I started writing my first novel because I was really bored at school and there was nothing to read. I read so
