The fire began during a severe snowstorm, spreading rapidly due to heavy winds and falling timber. Few contemporary accounts of the event exist, and the most reliable are those written by Sir Robert Kersey (or Kersy), Sir Richard Steele, and John Evelyn. [Wikimedia Commons] Historians have been fascinated by the Great Fire of London because of the implications it had for London and Britain. It has been estimated that more than 20,000 people were killed during the course of the fire. It was the largest fire in British history and one of the deadliest, destroying around six acres of the eastern portion of the city. The fire started on Pudding Lane, in the Farringdon area of the City, on the morning of Wednesday, 2nd December, 1666. That day, temperatures in the city reached a peak of 16.9 degrees C (62.4 degrees F), and there were winds of 50-80 miles per hour. The area in which the fire burned was densely populated, and it is estimated that more than 50,000 houses, shops and tenements were destroyed. The result was devastating, with it being reported by King Charles II that London was "like to be totally consumed in two or three days". Records of deaths caused by the Great Fire of London date back to the early 1680s, and by this point the fire had become so well-known that the details of many of the deaths were recorded in detail. These records were compiled in The Great Fire of London, a book which was published in 1889. By the late 19th century, the true scale of the death toll had been analysed and estimated that the fire killed 10,600 people, in addition to the many that died of various illnesses and injuries afterwards. Modern historians' research has been greatly advanced by the availability of surviving records. During the period

The advent of network technologies, which allow users to communicate with each other, has made it possible for people throughout the world to communicate via the Internet and other networks. As a result, it has become important for businesses to be able to track the online actions of customers and potential customers so that it can take advantage of those actions to deliver targeted marketing messages and so on. One method of tracking actions online is through cookies. Cookies are small files which are sent to a user's hard drive from a web server and stored there. The cookies may store, for example, the name of the web page that the user has visited in the past. In this way, when a user visits the same web site again, the web server can send the user the same cookies that it has already sent. Thus, the web server does not have to send the user a "cookie file" from the web server to the user's computer each time the user visits the web site. The web server can simply check if the user has any of the cookies that it has stored. Cookies provide some benefits to users. For example, cookies are one means of preventing the 1cb139a0ed
