A new K1 salt, Na3 KF3 [Ln(NMe2)3]2(µ-F), has been synthesized for the first time and characterized structurally and electrochemically. This novel anion [Ln(NMe2)3]2(µ-F) and anion [LnF2]2(µ-F) have been characterized by single-crystal X-ray diffraction (SC-XRD) and solid-state NMR, which give insights into its structure and electrochemical properties. In addition, the structure of the parent salt LiF [Ln(NMe2)3] (Ln = Y, La, and Lu) has been determined and shows that the same structure is retained as Ln-F1- compounds, which exhibit a long-range order and polymorphism. Sodium-ion batteries (SIBs) have been assembled with the LnF2 anion with both metallic Li and Na counteranions as the cathode active materials, and the performance of the anodes was investigated in detail. The electrodes with the K1 salt [Ln(NMe2)3]2(µ-F) exhibit a stable and high-capacity discharge profile even at high current densities and with a long cycle life. A Li/K1/Li cell with the K1 salt [Ln(NMe2)3]2(µ-F) and Na3 V2O5 as cathode/anode materials shows stable voltage profiles with an average discharge capacity of 1300 mA h/g and 700 mA h/g in the 10th cycle.�s own task force for the Calculus Exam.
