As I understand it, Newegg doesn't actually get paid for the review - but rather, the reviewer gets paid via coupons. The coupons are redeemable if the reviewer's score is high enough. This model is similar to Amazon Vine, where the 'Vine' gets paid for reviews, and the author can redeem the earned coins for discounts off future purchases. I'm wondering how often reviews like this one would be removed by Newegg's team of SEO reviewers.A motorcyclist was killed early Sunday when his motorcycle crashed through the glass doors at a restaurant in Burbank, authorities said. In particular, it relates to calibration and compensation of sensor distortion in digital cameras. Digital imaging or video cameras use an array of photosites (such as CCD, CID or CMOS sensors) to sense light and produce a digital image or video clip. In some cases, images are later processed to improve resolution, such as by using stitching to combine data from multiple photosites to create a larger pixel. In the general case, the digital image is then further processed for display or storage in a computer memory, or for archival purposes. Often, however, the digital image is displayed on a computer monitor, which itself has its own finite accuracy. In this case, the image sensor itself may distort the color and/or contrast of the image. This is due to the fact that the photosites have fixed, non-linear response characteristics, due to the internal conversion process. The characteristics of this non-linearity vary from photosite to photosite, because the design
