A: By the way, the "PMDG 777-200LR F 300ER Expansion Freel" is the PMDG 777-200LR aircraft. The link () you've posted points to the PMDG 737 expansion pack. You probably wanted to link to the same topic, when finding out that the topic was pointing to the same book. Soil organic carbon and carbon cycle in boreal tundra at the treeline. A 3-year study of soil organic carbon (SOC) cycling in boreal tundra was performed at the treeline in Alaska, USA. The objective of the study was to link the aboveground carbon cycle to the belowground carbon cycle by examining organic carbon allocation patterns, and to evaluate the relative importance of decomposition and deposition to SOC dynamics at the treeline. SOC content, carbon to nitrogen ratio, and lignin content, as well as isotopic signature, all confirmed the results from a previous field study. Soil respiration and net primary productivity rates did not differ significantly between the treeline and understory at the temperature typically found under the treeline. However, the decomposition
