Tip The gradient tool only takes single colors. 1. Select the Eraser tool. In the Toolbox select the small tool on the left in the middle of the tools. 2. Select a color in your color palettes (Tools → Color panel → Palettes...). 3. When you click, the Eraser tool inverts your image colors. You can use the Eraser to remove all the colors in an area or just the most prominent colors. 4. Click and drag on the image. The Eraser removes whatever you drag out of your image, leaving the colors of the original image. 5. Click and drag your brush over an area on your image to cut out a section.

What's New In Download Photoshop For Free Latest Version?

The present invention relates to a method of etching a brittle material such as a semiconductor substrate or a hard disk, and more particularly to a method of polishing a surface of a substrate material, in which a brittle material such as a semiconductor substrate or a hard disk is etched, with a use of a polishing apparatus. As disclosed in U.S. Pat. No. 5,928,244, JP-A-5-309106, and JP-A-8-58025, the following technique has been proposed. A substrate material such as a semiconductor wafer or a glass plate is mounted on a rotating carrier and rotated. A polishing pad is pressed against the substrate material through an abrasive member and rotated relative to the substrate material. Concurrently, abrasive liquid is supplied onto the surface of the rotating polishing pad, thereby polishing the substrate material. In the case where an abrasive member, a polish pad, a holding member, and a drive mechanism are integrally attached to a head, it is necessary that the surface of the substrate material be polished down to a predetermined thickness within a short time and the substrate material is prevented from being damaged. Also, it is desirable to press an abrasive member against a substrate material firmly. However, the abrasive member is pressed against the substrate material through the entire surface of the abrasive member, so that a desired surface roughness cannot be obtained by a conventional method. That is, if the entire surface of the abrasive member is pressed against the substrate material, a problem will arise that a desired planarity cannot be obtained. Also, an uneven portion will remain on the surface of the substrate material due to the pressing force. It is an object of the present invention to provide a technique for uniformly pressing an abrasive member against a substrate material, while preventing the substrate material from being damaged, and for finishing the substrate material to a desirable level of planarity. To achieve the above object, according to one aspect of the present invention, there is provided a method of polishing a surface of a brittle material, comprising the steps of: rotating a brittle material such as a semiconductor wafer or a hard disk for polishing; pressing a portion of the rotating brittle material at a predetermined pressure against a rotating rotary pad; supplying abrasive liquid against a portion of a surface of the rotary pad pressed against the rotating brittle material to thereby etch the portion of the rotating brittle material and to polish a
