It does not have a closed form solution; I can calculate it numerically given t . But I need to determine the transformation of this function. I do not know how to do this. Can you please suggest a method? I am not looking for a closed form solution. A: To find the transformation you need to find the CDF, which is the inverse of the probability density function: $F(x) = \int_{-\infty}^x p(y) dy = 1 - \int_x^{\infty} p(y) dy$ In your case $F(x) = 1 - \int_x^{\infty} \frac{1}{1+e^y} dy$ $F(x) = 1 - e^{-x} + x$ Group calls on both US and China to support Myanmar's peacemaking BY CAROLINE MILLIET YANGON — An international human rights group called on the United States and China on Thursday to pressure military leaders in Myanmar to find a peaceful solution to the state violence that has engulfed the country in the past three months. In a report, the rights group said ethnic-based fighters “appear determined to exterminate each other’s communities,” adding that ethnic divisions are deepening and information about the conflict is difficult to verify. A total of about 600 people have been killed. Since a new government was formed in May in Myanmar after decades of military rule, the country’s army has launched a brutal campaign against the country’s ethnic minority communities in the northwest of the country. In a statement released this week, the United Nations special rapporteur on human rights in Myanmar said that the military had carried out “massive, systematic and widespread” crimes that have included “acute and significant violations of human rights.” Aung San Suu Kyi, the de facto leader of the country, has appeared largely powerless to influence events. In comments to a fellow Nobel laureate earlier this week, she insisted that she could not be blamed for the violence, saying that she 1c8b36666d

I feel as if every time there's a security breach people quickly jump on the bandwagon of all new things that should be changed. For example, when Google announced the Android mobile operating system a lot of security experts said it was just a matter of time before some hacker would find a way to use it to his/her advantage. So now it's just a matter of time before Apple fixes it. The same thing with password resets. Millions of people have been complaining about the hard reset process that Apple introduced in iOS 9 and OS X El Capitan. I'm sure at least as many people (if not more) hate the fact that it's now a requirement for all new devices. I don't get it. Why do so many people hate this particular bit of change? I'm sure most of the people whinging about it have no idea what's being used behind the scenes. What are the flaws with it? What are the practical issues that it causes? A: It's pretty much the same fear/paranoia of mobile phone OS's as mentioned in the other answer. Basically, the fear is that a hacker could take control of a device and do anything from accessing other accounts to uploading information that could be very valuable to your bank. Even if you have the new "
