Field of the Invention The present invention relates to an article transport apparatus, and more particularly to an article transport apparatus that is suitable for use as a mechanism for transporting a sheet during inspection of the sheet, such as sheets used in sheets discharged from an image forming apparatus, or for transporting a sheet, such as a

copy sheet or an original, upon a treatment, such as an optical sensor, or a fixing device. 2.

Description of the Related Art

There is known an image forming apparatus, such as a copying machine, including a sheet transport apparatus that transports a sheet, such as a copy sheet or an original, by transporting rollers which are provided in a secondary transfer portion and the leading edge of the sheet is grasped by the rollers and lifted up and then conveyed along the secondary transfer portion by a lift mechanism. The transport rollers have a function of transporting the sheet in a primary transfer portion to a secondary transfer portion. In order to achieve a reduction in size of a transport roller, there is also known a structure in which the whole of the transport roller is rotatably supported on a support member disposed on a base

plate of the apparatus, as disclosed in Japanese Unexamined Patent Publication No. H4-306052. On the other hand, there is known a structure for lifting sheets from a sheet conveyance surface, such as a sheet transport belt, in a detachable manner to a predetermined height by an air cylinder. In this structure, a stopper is provided on a side opposite to the sheet conveyance surface of the sheet transport belt, and sheets are transported in a direction that is opposite to a direction in which the stopper is located, i.e., in a direction that is orthogonal to the sheet conveyance surface. In the above-mentioned sheet transport apparatus, when the sheet is transported to a predetermined position in a sheet conveyance route, the sheet having been lifted by an air cylinder is held by the stopper at
