Read the infographic below to get an overview of the Photoshop Elements features. 10 Photoshop Elements Features In this article, we will cover the 10 most important features of Photoshop Elements. Read on to get to know them and start using them. 1. Selective Editing Get better results in less time with selective editing. Selective editing is a powerful feature of Photoshop Elements. It allows you to edit selected parts of an image while maintaining the original version in the background. It has been initially developed for photographers but it can be extremely helpful for web designers, graphic designers, and even hobbyists. During its development, Adobe has taken into account the usability problems that sometimes occur when doing selective edits. For example, in the early versions of Photoshop Elements, if you select a layer, you would select only the pixels of that layer. However, it was not clear how much of the original layer you would lose. A small mistake could mean the loss of the whole image. In this version, the functionality of select layer improved significantly. Now you can change the original version and keep the selected parts. 2. Red Eye Correction Photoshop Elements features a powerful red eye correction feature. This feature allows you to enhance the focus of an image by removing the red eye effect. Usually the red eye effect is caused by the reflection of the light on the camera lens, the flash, or the ambient light. Photoshop Elements allows you to detect and eliminate this effect automatically. 3. Spot Healing Brush The Spot Healing Brush is an amazingly powerful and easy to use feature of Photoshop Elements. It can be used to completely remove certain types of objects such as pimples, or to correct a specific area of the image. This tool works extremely well for minor problems such as one or two shadows that need to be removed. 4. Clone Stamp The Clone Stamp allows you to enhance the appearance of an image even after an annoying blemish has appeared on it. In addition, this feature can help you out when you need to cut or remove objects from the main parts of the image. 5. Merging Layers One of the most difficult editing tasks is merging layers. With Photoshop Elements you can do it very easily and efficiently. With the help of this tool you can make an image which contains more than a single layer. 6. Zoom Photoshop Elements offers you a feature which will make any beginner's day. Thanks to 388ed7b0c7

Effect of interference from 2-deoxy-2-(18F)fluoro-D-glucose on positron emission tomography/computed tomography in the evaluation of recurrent head and neck cancer. 2-Deoxy-2-(18)fluoro-D-glucose (FDG) positron emission tomography (PET)/computed tomography (CT) is an effective means of detecting recurrence in patients treated for head and neck squamous cell carcinoma. However, there is inherent interference from FDG activity in surrounding soft tissues in the oral cavity and nasopharynx. The aim of this study was to investigate this inherent interference in patients with recurrent head and neck cancer who had undergone radiation therapy. Retrospectively, the data from 23 patients with head and neck squamous cell carcinoma who had developed evidence of recurrence during long-term follow-up who had undergone radiation therapy and had undergone PET/CT were studied. The mean interval between radiotherapy and PET/CT was 73 +/- 62 days. PET/CT images were evaluated for patterns of recurrence in the head and neck by a single radiologist and a referring physician. Positron-emitting activity was recorded from the oral cavity, nasopharynx, and skull in the PET images. Location of the activity was then compared with the CT images, and the presence or absence of reaction in the oral cavity was recorded. There were 12 patients with recurrence in the oral cavity, 6 in the nasopharynx, and 5 in the skull. Recurrence could be documented in the lesion in 11 of the 23 patients. Patients with facial invasion (n = 15) had a lower rate of radiation-induced artifactual activity in the oral cavity (8 of 15, 53.3%) than patients without facial invasion (23 of 28, 82.1%) (p = 0.037). Radiation-induced artifactual activity in the oral cavity is more common in patients with a poor facial appearance.Spread the love The US Treasury Department has expressed a concern over the use of bitcoin as a security for illicit activities, and has ordered the US financial services regulator to examine how the cryptocurrency could be used to facilitate illegal activities. The regulatory review is being carried out by the Financial Crimes Enforcement Network, a division of the Treasury Department. A notice from FinCEN was published in the Federal Register this week, indicating that the agency was required to perform a risk assessment on the use

Do Bully Episodes Decrease With Age? The social-behavioral research on bullying has focused on children. But now a series of important studies is set to begin in middle school, offering new insights into bullying, cyberbullying and the effects of exposure to these forms of victimization. This special report looks at the research on the question of whether middle school students continue to face the same risks and dangers of victimization as children. Studies of kids have shown that physical bullying declines from age 5-6 to 6-7 and that verbal bullying increases. By age 7, physical bullying remains fairly steady, but verbal bullying declines. "I think that the decline in physical bullying between middle school and high school is really interesting," said Marcelle Pickett, a prominent researcher on bullying at the University of Maine, Orono. In New Zealand, Pickett said, childhood and adolescent suicide rates have been on the decline for decades, yet there has been an uptick in youth suicide in recent years. "I think that the rise in youth suicide might be explained, in part, by the change in bullying," Pickett said. "We know from research, and we hear anecdotally, that the number of bullying episodes that children are exposed to is in decline." For decades, Pickett said, bullying has been the norm. In middle school, students report an average of about four bullying episodes per week. By high school, this declines to about one incident per week. But Pickett said she is not surprised to see evidence that middle schoolers are still at high risk for victimization. "I would say that our findings show that the landscape has actually not changed," Pickett said. "It remains kind of the same. I was surprised to see that the rates are the same. I was really surprised. And I think we should expect to find a lot of similarities. I think that it doesn't really surprise me that there is a drop in physical bullying in middle school, because middle school is a time of transitions. You're moving into middle school and your peer group is really important." Peter Glick, chair of the department of

social psychology at Virginia Commonwealth University, said his research focuses on identifying students at risk for victimization. "We've really focused on peer victimization in middle school, because we thought that would provide a really good window into seeing which kids are really the at-risk kids and where that risk changes,"
