Using stock images People are always snapping photos, so you can probably find an image that fits your needs already. You can use a stock photo in your design if you have the license to use the image. Because you can't actually own a stock photo, you need to be careful in how you apply it to your designs. Some images are licensed to people, while some are licensed to organizations. If the image is licensed to an organization, you are not the organization; you are just the licensee. You will be responsible for any fees related to the images that you use, depending on how you obtained them. When you're dealing with a stock photo, you need to read the fine print on the image. If the photo is licensed to a particular company or entity, you need to make sure that your use of the image is not in violation of their copyright. You need to ask permission to use the image. If you are using an image that you don't have permission to use, then you're in violation of copyright. Usually, you find out who owns a particular image when you request permission. A few stock photography sites let you create your own account if you provide contact information, so you don't have to worry about multiple licenses. However, stock images are licensed in various ways. If you don't know if you can use the image, you may want to consider obtaining permission before using it. In the following sections, we explore the basics of using stock images.

With a new franchise, the New England Patriots can take a fresh look at just about every player on their team. A year after the Patriots selected NFL rushing leader Ezekiel Elliott out of Ohio State with the third overall pick in the 2016 draft, running back Le'Veon Bell is set to become a free agent this offseason. And while Bell will be the flashier option to come out of the draft, the Patriots may look for a deeper back who can help their run game. Here's a breakdown of what the Patriots could do with Bell and how the running back could help them in Year 2. Bell's best fit: Bell fits into the Patriots running scheme perfectly. New England runs the ball in between the tackles on nearly half of its plays, and Bell should help ease the workload on quarterback Tom Brady. New England also runs less than almost any other team in the league, so Bell would be more of a two-back system than a one-back system. This is best seen when looking at the way New England's rushing attack finished last season, when Bell and Elliott both tallied consecutive six-touchdown seasons. In Bell's first year in the NFL, he still finished 20th in rushing yards, but he did play his fair share of snaps at running back, seeing his load increase while combining for just 10 rushing touchdowns. The Patriots used Bell at running back 53 percent of the time in 2017. The next highest percentage in the league was 52 percent for the Seattle Seahawks, which is relatively low for a team that runs often. This should tell the Patriots that Bell could do a lot of damage as a short-yardage back, as Bell averaged 5.6 yards per carry on his 1,698 total rushing attempts. The Patriots ranked in the top half of the league with a 4.8 yards per carry average, but New England ranked 16th in the league in total rushing yards and averaged 3.9 yards per carry. The Patriots could use some help at running back. Signing Bell should be a welcome sight for New England running backs coach Shane Vereen. Vereen was a different kind of running back for the Patriots during the last two-plus seasons, as he ended his time with the team with 1,390 rushing yards from 2013 to '15. It's unclear how much Vereen will be involved with the running backs as a pass-

Our results corroborate the recent findings by Castellanos et al. \[[@pone.0237034.ref009]\] who compared the results of patients who received medical education and were part of a multidisciplinary team (MDT) that also included a dietitian, compared to the same surgical team with a dietitian providing nutritional information. The authors found no differences in one year postoperative complication rates (p = 0.2), as well as no differences in the nutritional parameters such as weight, BMI, and percentage of protein and energy intake. Another study, however, comparing patients who had received previous nutritional intervention at least 6 weeks prior to surgery with patients who had not, showed that although there were differences in postoperative complications, including wound infection, pneumonia, surgical complications and death, there were no differences in nutrient intake. They concluded that the potential benefit of early nutritional assessment, as compared to a traditional perioperative assessment and intervention, is not clear \[[@pone.0237034.ref010]\]. In our study, the potential of nutritional support on postoperative complications could not be determined, due to the inadequate sample size. However, the comparisons of nutritional parameters between patients who did or did not receive nutritional support were not statistically significant. A longer follow up period is needed in future studies. As indicated, patients who received nutritional support did not show differences in nutritional parameters, or in their nutritional status, compared to those who received standard care, but they did show fewer complications, including fewer episodes of diarrhea. This could be explained by the fact that those patients had a more severe disease, had undergone previous surgical interventions, and were referred to the tertiary center, where the intensivist was available 24/7 to treat
