The new real-life player motion data has been integrated into “on-screen” player animations, and an evolution of the Player Impact Engine, which powers AI and animation. FIFA delivers the player behaviour that was used in the real-life match situations for the first time in a video game, allowing players to control how they would react to contact, to take difficult headers, and to last-ditch tackle challenges. How does it all work? The evolution of FIFA’s AI this year takes its starting point from the analysis of thousands of high-intensity real-life match data gathered using 22 player movement suits, and the results from 22 players - over 1.5 hours of high intensity football - were loaded into the game. There is no longer a single team or player provided by

the game maker - it is 22 players individually simulated. Every player is recreated in the game, from their movement, heading, tackling, passing and shooting capabilities, with true Player Impact Engine intelligence. We then use the real-life player data from the 22 matches to replicate everything that was recorded. So we've combined the play data, augmented it and analysed it in detail, but then we've gone one step further by creating these 22 players in the first place. We've created the AI for each player, and we've automated everything we did manually. So there's no manual checks of that stuff. All the way through, it's been automated. Graphical changes While the graphical environment within FIFA 22 has also evolved, the game is approximately 65 per cent bigger than the

FIFA title released in March 2011. "This new game is very powerful," said Peter Hines, Executive Producer. "We're creating a more accurate match environment, with more weapons to use in your attack, more weapons to defend with, more ways to score and more ways to be successful. Now a team can set up and execute multiple strategies, and every tactic and strategy is possible. And now players can be even more diverse and expressive, running and creating even more individual footballing styles."

Nifty graphics Instead of six championships for each country, FIFA 22 introduces two nations each, 14 leagues and the popular UEFA Champions League. "A club's season is between 28 and 30 games long, and the international season is

CONTROLS Thumbstick aiming Accurate and powerful in an instant, the new aiming system is easy to learn, yet

incredibly accurate. In one motion, just flick left or right to shoot with pinpoint precision. Accurate, responsive and accurate, you can shoot with less fuss and more accuracy and control.

Thumbstick passing Thumbstick passing, or flick passes, are more difficult to complete than those done by using analogue sticks to control the ball. The more cautious you are with your passing, the more difficult it can be, so at first you'll have to use the analogue sticks to pass the ball accurately. With practice and time spent aiming your passing, however, you'll be able to shoot the ball with just the flick of your thumb. Accurate and powerful aiming The new aim system is the most accurate aiming system to date, and includes a new 'Tap Turn', which will allow you to simply flick left or

right for distance. Enhanced player collision A whole new array of player collisions has been introduced, which will ensure a much more realistic and convincing experience when defending and attacking. New defensive system Defensive tactics have been enhanced to offer a more active and challenging experience to match new-found defensive

continuous caster, rotary caster, thin slab caster or the like, in which molten steel is poured from a ladle into a tundish, from which it flows in a thin slab through a number of parallel rows of nozzles into a mould. The casting rate for this application is commonly in the range of 0.2-3.0 kg/m²/minute. The conventional continuous casting machine operates as follows: molten steel from a ladle is continuously poured through a tundish and into a mould cavity which is open to the atmosphere. The molten steel fills the mould cavity until the desired thickness has been formed. The mould cavity is then closed by a bottom nozzle, and the cast slab is allowed to stand in the closed mould cavity until it solidifies. The solidified

cast slab is then quenched by flowing chilled water onto the casting surface to reduce the casting temperature, followed by opening the mould cavity to extract the cast slab. Many continuous casting machines have as a primary objective the minimization of the porosity of the cast slab. Steel casting scientists have long recognized the importance of careful control of the morphology of the solidification fronts and the role of oxide inclusions in controlling the morphology of the solidification process. If the cooling rate is too high, the steel may solidify in a self-contained region that leaves voids behind as the liquid steel solidifies. This is commonly termed a blocky structure and is accompanied by an

increase in porosity. On the other hand, if the cooling rate is too slow, the steel may solidify in a manner that promotes oxide inclusions. This is commonly termed a grainy structure and is
