Tuesday, July 28, 2009 Good old text editors. They are the backbone of most of us programmers. I use them on a daily basis for such tasks as: Code editor: After a long day, I feel tired, and I want to get back to programming. Instead of going to my C/C++ book, I stay in the comfort of my terminal and do some programming in a text editor. Script editor/IDE: If you've seen `*code::blocks*`, it is exactly what a "code editor" is supposed to be. Note: I have a Windows at work, and right now I am free on the Mac, so here is the experience I had in Windows Vim. You might need to change the path. Open Vim, and type `:help` to get started. The opening line will display all the options for Vim. You might want to take a peek at `:helpw` and `:helpu` to view options that start with `":help"`. What you are looking for is probably help for the command you want to execute. For example, `:help netrw`. At this point, you might ask: "Ok, but what can I do

---

after :help?" It seems you might not be the only one asking that, because there is already help online. To view it, visit [www.vim.org](http://www.vim.org) and click "Help". Now, Vim is quite good in looking for help from online resources. It finds those online sources and displays them in your help document. You might want to take a look at the Vim online version of its help. This version of Vim allows you to type the help keyword in some Vim commands and then you will see the help for that command. I am not using this version, because its help is limited, but some people find it useful. Once you have looked at all the help for the command you want to use, press CTRL + ] to jump back to the command you were last looking at. Now, you know all about the function of CTRL + ] and that is why we would not need a separate help function. Well, that is about all I found useful for now. Next time, I will have to write a somewhat shorter post with a short summary.

Q: Convert to milky to normal RGB values in a Mathematica. I converted to A from RGB values in a file of my camera, the problem is

The Gradient tool allows you to select a color in your image, and then paint straight into the image, or any area you click with the default brush. Gradient tools are very useful for compositing images together. The Healing Brush is used to correct and smooth out areas of an image that are covered by another. It works much like the Clone Stamp but in reverse. The Pen Tool or Brush Tool can be used to create many different artistic effects. Depending on the type of brush selected, it will create a different type of mark. The Quick Selection tool allows you to select the area of the image you want to work on. Using other tools such as the Pen Tool or Brush Tool, you can modify that selection. Photoshop's Effect Panel allows you to change the overall look of an image. You can use filters to turn your images into works of art. You can also use these filters to manipulate certain areas of an image. These filters can be used on images at any point in the photo editing process. In this

lesson, you will learn about and use two Photoshop tools, the Pen Tool and the Brush Tool. You will also use Photoshop's effects panel. This is a very powerful set of tools and Photoshop comes with an amazing collection of different effects that can be applied to images. In the next lesson, you will learn about and use the Gradient tool. I am going to show you how to make your photos look special for various occasions. I can use some photos that are old, and they don't look as good as they once did. In this video, I want to fix my beautiful old photos, and turn them into something special. As you know, I'm always doing things with Photoshop, and I think you need to learn the basics of Photoshop, before you go do those amazing things. So, this is some basic stuff you need to know. Sometimes, when you use old photos, they are a little bit different than photos you have recently taken. This is because over the past decade, the quality of our cameras has gotten better. This means that your old photos don't look as good as new photos, and you are going to have to use Photoshop to make them

look good again. You know, I always try to make my life easier, so I'm going to use Photoshop for a change. Here we go. We are going to open up our old photo, which you can find on my website. For those of
